

Python Data Structure Practice Questions (Updated)

INT & FLOAT

1. Take two numbers as input and print their difference.
2. Multiply a float with an integer and print the result.
3. Divide a number by 2 and show the remainder.
4. Check if a given number is divisible by 7.
5. Round a float number to 1 decimal place.
6. Convert an integer to a float and print both types.
7. Take a float input and print its integer part only.
8. Use the modulus operator to get the last digit of a number.
9. Add 10 to an integer and then subtract 5 from it. Print the result.
10. Calculate simple interest given P, R, T (No loop needed).

STR (String)

11. Take a name as input and print its first and last characters.
12. Convert a string to uppercase.
13. Convert a string to lowercase.
14. Find the position of the first occurrence of 'a' in a string.
15. Replace all 'e' characters in a string with '@'.
16. Concatenate two strings with a space in between.
17. Print the length of a given string.
18. Slice the first 3 characters of a string.
19. Check if a string contains the word 'hello'.
20. Count how many times the letter 'i' appears in a string.

LIST

21. Create a list of 3 items and print it.
22. Access the second element of a list and print it.
23. Replace the last item in a list with a new value.
24. Append an item to the list and print it.
25. Insert an item at the second position in a list.

Python Data Structure Practice Questions (Updated)

26. Remove a specific item from the list.
27. Print the length of the list.
28. Sort the list in ascending order.
29. Reverse the list using slicing.
30. Join all elements in a list of strings into a single string separated by commas.

TUPLE

31. Create a tuple with 3 integers and print it.
32. Access the first element of a tuple.
33. Slice the tuple to get the last two elements.
34. Use the 'in' keyword to check if a value exists in the tuple.
35. Get the length of the tuple.
36. Convert the tuple to a list.
37. Count how many times a value appears in a tuple.
38. Find the index of a given value in the tuple.
39. Concatenate two tuples.
40. Check if two tuples are equal.

DICT (Dictionary)

41. Create a dictionary with keys: 'name', 'age', 'city'.
42. Access the value of the key 'name'.
43. Update the value of 'age' in the dictionary.
44. Add a new key 'email' with any value.
45. Delete the key 'city' from the dictionary.
46. Print all the keys of the dictionary.
47. Print all the values of the dictionary.
48. Check if 'age' exists as a key in the dictionary.
49. Get the value of a key using the get() method.
50. Clear all items from the dictionary.

Python Data Structure Practice Questions (Updated)

SET

51. Create a set with 3 numbers and print it.
52. Add a new element to the set.
53. Remove an element from the set.
54. Check if an element exists in the set.
55. Find the union of two sets.
56. Find the intersection of two sets.
57. Find the difference of two sets.
58. Copy a set to a new variable.
59. Check if a set is a subset of another.
60. Clear all elements from a set.
