

1. Questions Based on Lists

- a. Ask the user to input a list of elements (comma-separated) and reverse the list using slicing.
- b. Prompt the user to enter a list of numbers (comma-separated), and find the sum of all elements using a built-in function.
- c. Take a list of numbers as input from the user and find the largest element using a built-in function.
- d. Ask the user for a list of elements and a value to check if it exists in the list using the `in` operator.
- e. Prompt the user to enter a list and a value, then count its occurrences using a method.
- f. Ask the user to enter two lists (comma-separated) and concatenate them.

2. Questions Based on Strings

- a. Take a string as input from the user and find its length using a built-in function.
- b. Ask the user to enter a string and a substring, then check if the substring exists in the string using the `in` operator.
- c. Prompt the user to enter a string and display its uppercase and lowercase versions.
- d. Ask the user for a string, a target substring, and a replacement substring, then replace all occurrences.
- e. Take a string input from the user and check if it is a palindrome using slicing.
- f. Prompt the user to enter a string and indices (start and end), then extract the substring using slicing.
- g. Take a string and a character as input, and find the first occurrence of the character using a method.
- h. Ask the user for a string and a delimiter, then split the string into a list and join it back with another delimiter.
- i. Ask the user to enter a string, then count the number of vowels using a combination of `count` and `sum`.
- j. Prompt the user for two strings and concatenate them using the `+` operator.
- k. Ask the user to enter two lists (comma-separated) and concatenate them using `+`.

3. Questions on Tuple :

- a. What is a tuple in Python? How is it different from a list?
- b. How can you create a tuple with multiple elements in Python?
- c. How can you access an element of a tuple by its index?
- d. Can you change the elements of a tuple after it's created?
- e. How can you concatenate two tuples?
- f. How can you repeat the elements of a tuple multiple times?
- g. How do you find the length of a tuple?
- h. How can you check if an item exists in a tuple?
- i. How can you get the maximum and minimum values from a tuple of numbers?

- j. How do you convert a tuple into a list.

1. Set Questions:

- k. What is a set in Python? How does it differ from a list or tuple?
- l. How do you create a set in Python?
- m. What happens if you try to add duplicate values to a set?
- n. How can you check if an element exists in a set?
- o. How can you add an element to a set?
- p. How can you remove an element from a set?
- q. How can you find the union of two sets?
- r. How do you find the intersection of two sets?
- s. What is the difference between two sets?
- t. What is the symmetric difference between two sets.

2. Dictionary Questions:

- u. What is a dictionary in Python? How is it different from a list?
- v. How do you create a dictionary with keys and values in Python?
- w. How can you access a value in a dictionary by its key?
- x. How can you add a new key-value pair to an existing dictionary?
- y. How can you remove a key-value pair from a dictionary?
- z. How can you check if a key exists in a dictionary?
- aa. How do you get all the keys and values from a dictionary.
- bb. How can you modify the value associated with a key in a dictionary
